                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
the tissue, especially porcine heart, liver, kidney or pancreas, rendering it more suitable for transplantation, i.e. less immunogenic and of increased immunological acceptability. A claimed method of producing a cell from a donor species that is immunologically acceptable to a recipient species involves reducing levels of carbohydrate on the donor cell that causes it to be recognised as non-self by the recipient by causing a nucleic acid for a glycosyltransferase such as Se to be expressed in the cell. Expression units, such as retroviral packaging or produce cells, containing Se nucleic acids can be used in gene therapy.

                                                                                                                   The present sequence encodes pig secretor used in an example of the present invention. The present invention describes nucleic acids (NA) encoding a chimeric glycosyltransferase. The NAS comprise a caralytic domain of a first glycosyltransferase (GT) and a localisation signal of a second GT, whereby when the NA is expressed in a cell and where the chimeric enzyme is located in a marea of the cell where it is able to compete for substrate with a second GT, resulting in reduced levels of a product from the second GT. The NAS can be used to produce cells and organs with desired glycosylation patterns. Products and methods of the present invention can be used to reduce the levels of undesirable epitopes in cells, issues or organs which may be used in

The DNA encodes a alpha(1,2) fucosyltransferase and is the Secretor alpha(1,2) fucosyltransferase locus, that cross hybridises with the H blood group alpha(1,2)fucosyltransferase gene. The DNA is useful for producing a recombinant human GDP-L-fucose:beta-D-galactoside 2-alpha-L-fucosyltransferase (FUT2) which can be used for genotyping an individual as a secretor or nonsecretor as it is known that nonsecretors homozygous for a mutant allale of the FUT2 gene that has a stop codon in the position corresponding to amino acid 143.
                                                                                                                                                                                                                          Sec2; alpha(1,2) fucosyltransferase; H blood group; secretor genotyping: GDP-L-fucose:beta-D-galactoside 2-alpha-L-fucosyltransferase; human; FUT2; nonsecretor genotyping; ds.

                                                                                                                                                                                                                                                                                                                                          The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical expent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (1) of a signature gene set, where (1) comprises a sequence (8) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (8), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of canners used as colon, breast, stomach, lung, thyroid,

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical expension by the method involves exposing cells to a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is inflicient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarchoma, carchinoma, clear cell cancer, infiltrating ductal can infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carchoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ر

Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in

expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent which result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, and Wilm's tumour.                                                                                                                                                       Swine alpha(1,2) fucosyltransferase; FUT1; Escherichia coli; resistant; E. coli-associated intestinal disorder; E coli infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes swine alpha(1,2) fucosyltransferase (FUT1). The specification describes methods relating to Escherichia coli-resistant swine. One of the methods for identifying a swine resistant to E. coli-associated intestinal disorders, comprises determining whether the base at 307 of alpha(1,2) fucosyltransferasel gene (FUT1) is adenine (sic), in which case the swine are resistant. The porcine FUT1 polymorphisms can be used to develop drugs for the treatment of swine having E. coli-associated disease. The methods can also be used in breeding programmes to identify swine with resistance

                                                                                                                                                                                                                                                                                                                                     resistant to intestinal colonisation by E. coli. The method comprises determining whether a genetic polymorphism associated with resistance to colonisation is present in a swine sample, and then inferring that the swine is resistant if it is homozygous for the polymorphism. The method uses the swine alpha-1,2-fucosyltransferase (FUT1) polymorphism. The present sequence encodes swine FUT1. The method enables the breeding of swine that are resistant to E. coll-related diseases. This method comprises breeding swine that have a genetic polymorphism in the FUT1 gene. Nor particularly, the identification method identifies swine that are resistant to E. coll-related intestinal disorders if, in a sample taken, the only nitrogen base at residue 307 in the FUT1 gene is adenine and the assay itself is used as a basis for a kit, applied to swine of any age, in detecting polymorphisms associated with E. coli FNB receptors. The polymorphisms are useful in developing drugs to treat source with the normal enzyme and prevent it forms the may interfere with the normal enzyme and prevent it forms the may interfere with the normal enzyme and prevent it

This is the nuclectide sequence of the pig FUTI gene encoding alpha-1-2 fucosyltransferase (see AAY9302). A polymorphism at position 307 of the conding region is associated with susceptibility to FIB Escherichia coli colonization; pigs homozygous for adenine at position 307 are resistant to colonization, while heterozygous canimals and animals homozygous for quantine at position 307 are resistant to colonization. A claimed method for improving weight useptible to colonization. A claimed method for improving weight resistant to E. coli colonization and feeding these animals high levels of plant-based protein concentrate. A claimed method for preventing FIB E. coli colonization in swine, especially swine that are genetically susceptible to FIB E. coli colonization, involves replacing some or all of the plant-based proteins in the diet with are genetically susceptible to FIB E. coli colonization, involves replacing some or all of the plant-based proteins in the diet with useful for developing drugs to treat swine that have E. coli associated disease. The polymorphism in the FUTI gene is also associated disease. The polymorphism can be detected using
                                                  Improving weight gain in swine using swine genetically resistant
Escherichia coli and feeding swine high levels of plant based protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1269 BP; 219 A; 413 C; 362 G; 275 T; 0 other;

1082 Feeding swine genetically susceptible to F18 Escherichia colicolonization with a low plant protein based diet increases weight gain and lowers intestinal disease associated with E. coli infection This sequence represents the swine alpha (1,2) fucosyltransferase (FUT1) gene. A FUT1 gene in which there is a base other than adenine at position 307, may be used for improving weight gain in swine that are genetically susceptible to F18 Escherichia coli. The weight gain may be activated by feeding a diet of at least 40% animal based proteins. The feeding method is used to control F18 E. coli associated intestinal disease in swine. Patent No. 6329170

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: GMI-SPECIFIC ALPHAI-2 FUCOSYLTRANSFERASE AND USES TITLE OF INVENTION: GMI-SPECIFIC ALPHAI-2 FUCOSYLTRANSFERASE AND USES FILE REFERENCE: 8511-029
CURRENT APPLICATION NUMBER: US/09/298,886
CURRENT FILING DATE: 1999-04-26
NUMBER OF SEQ ID NOS: 29
SOFTWARE: PATENTIN VEY: 2.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GENERAL INCORDATION:
APPLICANT: ETIC H. Holmes et al.
TITLE OF INVENTION: NUCLEIC ACIDS AND PROTEINS OF A RAT GANGLIOSIDE
TITLE OF INVENTION: GAL-SPECIFIC ALPHAI-2 FUCOSYLTRANSFERASE AND USES
TITLE OF INVENTION: THEREOF
FILE REFERENCE: 8511-029
CURRENT APPLICATION NUMBER: US/09/298,886
CURRENT APPLICATION NUMBER: US/09/298,886
SURRENT FILING DATE: 1999-04-26
SUFTWARE: PATCHIN VOET: 2.0

OTHER INFORMATION: The encoded product of nucleotide SEQ ID NO:
OTHER INFORMATION: 1: is the enzyme, GDP-L-fucose--D-galactoside 2-alpha-fucosy
OTHER INFORMATION: which has the amino acid sequence described in SEQ. ID NO:1:.
OTHER INFORMATION: is responsible for the synthesis of 2'-fucosyllactose.
                                                                                                                                                                                                                                 Р.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MOLECULE TYPE: Cloned cDNA representing the product of a MOLECULE TYPE: human genomic DNA segment DESCRIPTION: GDP-L-fucose- -D-galactoside 2-alpha-fucosyl-transferase
                                                                                                                           Sequence 1, Application US/0820889A
Patent No. 5750176
GENERAL INFORMATION:
APPLICANT: Prieto, P., Smith, D., Cummings, R., Kopchick, J., Mukerji, I APPLICANT: Prieto, F., Pierce, J.
TITLE OF INVENTION: Transgenic Production of Oligosaccharides and TITLE OF INVENTION: Glycoconjugates

HOD: DNA sequencing and restriction analysis
The encoded product of nucleotide SEQ ID NO:
1: is the enzyme, GDP-L-fucose- -D-galactoside 2-alpha-fuc
which has the amino acid sequence described in SEQ. ID NO:
is responsible for the synthesis of 2'-fucosyllactose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    217 GCCATGTTCACGATCAATTCCATTGGCCGGCTGGGGAACCAGATGGGCGAATACGCCACA 276

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
